Team Contributions

Rui Xu contributed to the implementation of the Performer-based Vision Transformer and participated in the integration of efficient attention mechanisms into the unified model framework.

Xinru Tian contributed to the implementation of the baseline Vision Transformer and the development of the experimental pipeline, including training, evaluation, and result aggregation across datasets.

Yingwen Liu contributed to the implementation of structured positional encoding variants, including Circulant-STRING and Cayley-STRING, and supported the integration of these components into the overall model architecture.

All team members participated in weekly meetings to discuss progress, adjust experimental plans, and coordinate implementation. The team collaboratively reviewed code, ensured consistency across modules, and jointly contributed to the writing and revision of the final report.
